

Thirteen Lakes Monitored in 2008

(Paid by the ISCCW)

Monitoring efforts are necessary to discover unknown locations of AIS in lakes that have no known infestations at this time. Monitoring work will occur on lakes with boat landing access that are geographically located completely or partially within the ISCCW coverage area and can include state boundary water lakes. Species to be included within the monitoring work are primarily Eurasian Water Milfoil (EWM) and Curley-leaf Pondweed (CLP). Hydrilla, Rusty Crayfish, Zebra Mussels and Purple Loosestrife will be noted if observed while monitoring for EWM and CLP.

Four Lakes Surveyed in 2008

(Paid by the ISCCW)

The following lakes have known infestations of AIS, and a specific survey plan was developed for each individual lake.

Duck

Clearwater

Crooked

Lindsley

Additional Lakes

Bass Lake used the MiddFoil process, which includes a lake survey and planting of weevils that feed on EWM. This was done by EnviroScience, Inc. (Some financial assistance from the ISCCW)

Langford Lake was chemically treated and monitored by the Army Corps of Engineers. (Paid for by the Army Corp of Engineers)

Big Lake was surveyed by the Wisconsin DNR.
